

How much power does Angola need?

In order to ensure a safe power supply, even in years of lower hydro flow, Angola should have 9.9 GW of installed capacity - through increasing power capacity in all sub-systems and through a strong reliance on hydro and gas (which will correspond, respectively, to 66% and 19% of installed power capacity).

Can Angola benefit from a high level of renewables?

The high level of renewables will also allow Angola to benefit from one of the world's lowest power sector emission factors - 98 g CO₂/kWh. **POWER PLANTS UTILIZATION AND ENERGY SECURITY** The operation of the installed generation plants will greatly depend on the hydrologic conditions (Figure 58).

What are the options for power generation in Angola?

Angola has numerous options for the generation of power. The present document considers the key options - hydro, thermal and new renewable - individually and combined in scenarios that meet the required levels of safety and redundancy.

Does Angola have a power pool?

Angola is currently a non-operating member of the Southern African Power Pool, but plans exist to connect to the pool through Namibia (Baynes Dam). Namibia and Angola are set for a joint construction of the Baynes Dam hydroelectric plant with an installed capacity of 600 MW.

How will the hydropower generation profile change in Angola?

In Angola, the hydropower generation profile will vary not only along the year but also within the typical day. The existing regularization capacity of hydro reservoirs will allow generation to be minimized during off-peak periods and increased during peak hours.

What is Angola's energy mix?

Angola's current installed capacity is estimated at 5.7 GW but only 70 percent is in use. The country's current energy mix consists of 61.8 percent hydropower, 37.6 percent other fossil fuels and 0.6 percent hybrid (solar/fossil fuel).
