The microgrid strategy proposed in this paper can flexibly choose different control modes to realize distributed control and centralized control, and has broad application prospects.

A microgrid is simply a "small scale grid." It does the same thing as the larger regional and national grids, but on a geographically more limited scale. It can be connected to the main grid, but once it obtains the power, it manages it through a smaller, more localized grid. Alternatively, the microgrid can have its own generation capability.
