

Where does energy come from in Italy?

Energy in Italy comes mostly from fossil fuels. Among the most used resources are petroleum (mostly used for the transport sector), natural gas (used for electric energy production and heating), coal and renewables. Italy has few energy resources, and most supplies are imported.

How energy efficient is Italy?

Traditionally high energy prices have made the Italian manufacturing sector one of the least energy intensive in the IEA. Energy efficiency can still be improved in some sectors (such as iron and steel, cement, and paper), in line with the best available techniques.

What will Italy's energy policy look like in 2030?

The government estimates that the use of renewables should grow to nearly 37% of gross final energy consumption in 2030 to be in line with the FF55 goals. This overall target would translate into higher sectoral targets (Table 5.1). In addition, Italy's ETP aims to generate 72% of electricity from renewable sources by 2030.

Did Italy exceed its renewable 2020 targets?

Italy exceeded its overall and sectoral renewable 2020 targets, as set out in the 2009 EU Renewables Energy Directive (RED) and Italy's National Renewable Energy Action Plan (NREAP).

What should Italy do to reduce energy consumption?

Italy should focus on reducing energy consumption in transport, buildings and industry. In addition to stimulating the uptake of more efficient technologies, Italy should put more emphasis on encouraging less energy- and carbon-intensive consumption and mobility patterns.

How has Italy's energy system changed since 2010?

Italy's energy system has changed notably since 2010 and today the country's energy mix includes more natural gas and renewable energies and less coal and oil.

From a lower base than the IEA average, Italy's energy intensity, measured by the ratio of total final consumption (TFC) to gross domestic product (GDP), declined by 15% between 2005 and ...

Italy is implementing several measures to improve the energy efficiency of residential and commercial buildings, with energy consumption already declining in this area. By 2030,

Italy has been at the forefront of the European renewable energy revolution, leveraging its natural resources to become a significant player in solar and wind power ...
