

The Quasar team is all about providing businesses and utilities with intelligent energy and power data to enable them to reduce costs, maximise operations and meet business goals. From extensive systems for large energy users and utilities, through to small billing systems, our three decades of experience as a system integrator ensures each ...

The Quasar team is all about providing businesses and utilities with intelligent energy and power data to enable them to reduce costs, maximise operations and meet business goals. From extensive systems for large energy users and ...

An integrated power system is a comprehensive, unified approach that enhances the management and delivery of power across the grid. By utilising advanced technologies and ...

Less power consumption under varied load circumstances, less space, excellent dependability and a wide input voltage are some of the major needs of today's power management systems. In a wide range of applications, these criteria ...

Capture the power of an all-digital, all-electric infrastructure for a more sustainable, resilient, efficient and people-orientated building. Integrate your EPMS and share energy and power information with other management systems such as EcoStruxure Building Operation and integrated workplace management systems.

An evolving shift toward higher rack power densities requires adapting data centre infrastructure. Watch our webinar on demand to learn the architectural requirements for AI training and ...

Intelligent networks: This area mainly involves the development of new concepts, network infrastructures and a regulatory framework for control, supervision and operation of electricity networks to transform the grid into an interactive service network, while maximizing reliability, power quality, efficiency and security.

This paper looks at options that could find relevance to New Zealand (NZ), in the context of its aspiration of achieving 90% renewable energy electricity generation portfolio by 2025. It also identifies developments in technical standardization and industry investments that facilitate a pathway towards an intelligent or smart grid development ...

We are looking forward to working with select innovators to provide bespoke advice to foster innovation and progress solutions to benefit the sector and consumers. Submissions for regulatory information and advice, and for entrance into Round 2 of the Power Innovation Pathway, remain open.

An integrated power system is a comprehensive, unified approach that enhances the management and delivery of power across the grid. By utilising advanced technologies and intelligent control systems, it is possible to ensure a cohesive and optimised system that is cost-efficient, offers optimised distribution and control of energy, and ...

Capture the power of an all-digital, all-electric infrastructure for a more sustainable, resilient, efficient and people-orientated building. Integrate your EPMS and share energy and power ...

Intelligent networks: This area mainly involves the development of new concepts, network infrastructures and a regulatory framework for control, supervision and operation of ...

An evolving shift toward higher rack power densities requires adapting data centre infrastructure. Watch our webinar on demand to learn the architectural requirements for AI training and inference workloads and hear best practices for addressing concerns ...

We are looking forward to working with select innovators to provide bespoke advice to foster innovation and progress solutions to benefit the sector and consumers. Submissions for ...

Unlock the potential of intelligent rack power management with our comprehensive range of solutions. We offer a wide array of innovative products that provide real-time insights into ...

Unlock the potential of intelligent rack power management with our comprehensive range of solutions. We offer a wide array of innovative products that provide real-time insights into power consumption, optimize energy efficiency, and enhance overall rack performance.

This paper looks at options that could find relevance to New Zealand (NZ), in the context of its aspiration of achieving 90% renewable energy electricity generation portfolio by 2025. It also ...

Less power consumption under varied load circumstances, less space, excellent dependability and a wide input voltage are some of the major needs of today's power management systems. In a wide range of applications, these criteria are driving the demand for highly efficient, wide VIN, low quiescent current (IQ) switching regulators.
