

Singapore res power for good

Does Singapore need a reliable energy source?

As Singapore transitions towards cleaner energy sources, reliable and sufficient energy sources are needed to ensure supply reliability. Natural gas will continue to be a dominant fuel for Singapore's electricity generation even as we scale up the other 3 Switches.

How is Singapore transforming its energy supply?

Singapore is therefore harnessing four Switches- natural gas, solar, regional power grids and low-carbon alternatives - to transform its energy supply, while promoting energy efficiency to reduce demand. As Singapore transitions towards cleaner energy sources, reliable and sufficient energy sources are needed to ensure supply reliability.

Why is Singapore using regional power grids?

To overcome our land constraints, Singapore is tapping on regional power grids to access cleaner energy sources beyond its borders. Regional power grids can help accelerate the development of renewable energy projects in the region, bringing economic growth and increasing access to renewable energy.

Who is Res?

RES is the world's largest independent renewable energy company active in wind, solar, energy storage, transmission and distribution. We have developed and/or constructed over 19 GW of renewable energy worldwide. Our vision is a future where everyone has access to affordable zero carbon energy.

Why should Singapore import electricity?

Electricity imports will also help us to diversify our energy sources away from natural gas and improve our energy resilience. Singapore is planning to import up to 4 gigawatts (GW) of low-carbon electricity by 2035, which is expected to make up around 30% of Singapore's electricity supply in 2035.

Will natural gas be a dominant fuel for Singapore's electricity generation?

Natural gas will continue to be a dominant fuel for Singapore's electricity generation even as we scale up the other 3 Switches. EMA will continue to diversify our natural gas sources and work with the power generation companies to improve the efficiency of their power plants.
